Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

What is long-range dependence?
Why does it matter?
Example

Definition (1)

Condition on the autocorrelation:

X_t is called a process with long-range dependence if there exists a real number $\delta \in (0, 1)$ and a constant c_ρ such that:

$$\lim_{\tau \to \infty} \frac{\rho_{X,\tau}}{c_\rho \tau^{-\delta}} = 1$$

where $\rho_{X,\tau}$ is the autocorrelation sequence of X_t at time lag τ.

Perspectives

What is long-range dependence?
Why does it matter?
Example

Definition (2)

Condition on the spectral density:

X_t is called a process with long-range dependence if there exists a real number $\delta \in (0, 1)$ and a constant c_S such that:
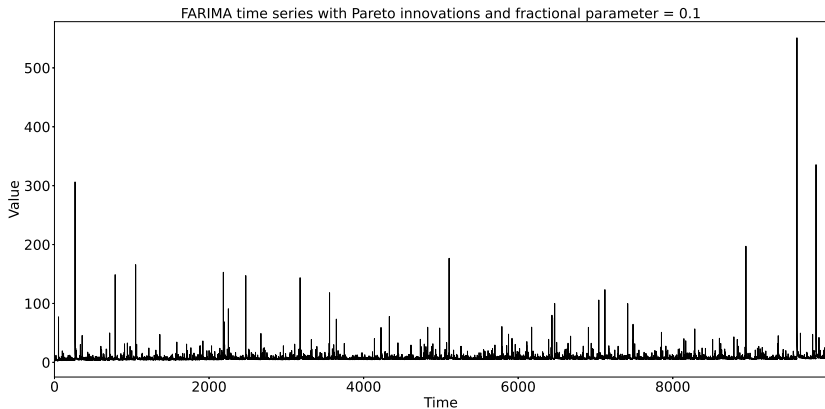

$$\lim_{f \to 0} \frac{S_X(f)}{c_S \, |f|^{-\delta}} = 1$$

where $S_X(f)$ is the spectral density of X_t at frequency f.

Method
Application to earthquake catalogs
Perspectives

What is long-range dependence?
Why does it matter?
Example

Non summable autocovariance sequence

High-lag autocorrelations individually small / Cumulative effect
cannot be neglected:

$$\sum_{\tau=-\infty}^{\tau=\infty} \rho_{X,\tau} = \infty$$

Long-range dependence

What is long-range dependence?
Why does it matter?
Example

Example of synthetic time series: ARFIMA(0, 0.1, 0) with Pareto innovations (10000 points)

FARIMA time series with Pareto innovations and fractional parameter = 0.1

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Low-frequency earthquakes (LFEs)

- Small magnitude earthquakes ($M \sim 0 - 2$).
- Reduced amplitudes at frequencies greater than 10 Hz.
- Earthquake source located close to the plate interface.
- Grouped into families: All LFEs from a given family originate from the same small patch.
- Dozens of LFEs within a few hours or days, followed by weeks or months of quiet.

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Example of an LFE family

Family 080413.07.023 (1298 LFEs)

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Statistical analysis of LFE occurrence

1. We look at each LFE family independently from the others.

2. We translate the sequence of LFE occurrence times into a discrete time series defined by the number of LFEs per unit of time.

Graphical methods to estimate LRD
Application to synthetic times series

Objective of the study

Look for evidence of long-range dependence by estimating the value of the Hurst parameter H or the fractional differencing parameter d:

$$H = d + \frac{1}{2} \text{ for finite variance processes}$$

$$H = d + \frac{1}{\lambda} \text{ for infinite variance processes}$$

If the time series is a FARIMA process with Pareto innovations, λ is the shape of the Pareto distribution.

Long-range dependence

Graphical methods to estimate LRD
Application to synthetic times series
Absolute value method

Aggregated time series:

$$X^{(m)}(k) = \frac{1}{m} \sum_{i=(k-1)m+1}^{km} X_i$$

First absolute moment :

$$AM^{(m)} = \frac{m}{N} \sum_{k=1}^{\frac{N}{m}} \left| X^{(m)}(k) - \bar{X} \right|$$

$AM^{(m)}$ behaves like m^{H-1} for large m

H = 0.77 (true value = 0.77) - R2 = 0.97

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Graphical methods to estimate LRD
Application to synthetic times series

Variance

Sample variance:

$$\hat{Var}X^{(m)} = \frac{m}{N} \sum_{k=1}^{\frac{N}{m}} \left(X^{(m)}(k) - \bar{X} \right)^2$$

$\hat{Var}X^{(m)}$ behaves like m^{2d-1} for large $\frac{N}{m}$ and m

d = 0.10 (true value = 0.10) - R2 = 1.00

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Graphical methods to estimate LRD
Application to synthetic times series

Variance of residuals

Blocks of size $m \rightarrow$ Compute the partial sums $Y(t) = \sum_{i=1}^{t} X_i$

Fit linear model and compute residuals:

$$\frac{1}{m} \sum_{t=1}^{m} (Y(t) - a - bt)^2$$

Compute variance of residuals.

Mean of variance behaves like m^{2d+1}

d = 0.10 (true value = 0.10) - R2 = 1.00

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Graphical methods to estimate LRD
Application to synthetic times series

R/S statistic

Divide into K blocks $\rightarrow$ Compute the
partial sums $Y_j(t) = \sum_{i=k_j+1}^{k_j+t} X_i$ with
$k_j = j\frac{N}{K}$ and $j = 0, \cdots, K-1$

$$R(j, n) = \max_{1 \leq t \leq n} \left[Y_j(t) - \frac{t-1}{n} Y_j(n) \right]$$
$$- \min_{1 \leq t \leq n} \left[Y_j(t) - \frac{t-1}{n} Y_j(n) \right]$$

$S(j, n) =$ square root of the sample
variance of $X(t)$, $t = k_j + 1, \cdots, k_j + n$

$R/S = \frac{R(j,n)}{S(j,n)}$ behaves like $n^{d+\frac{1}{2}}$.

d = 0.15 (true value = 0.10) - R2 = 0.95

Perspectives

Graphical methods to estimate LRD
Application to synthetic times series

Periodogram

Periodogram:

$$I(f) = \frac{1}{2\pi N} \left| \sum_{j=1}^{N} X_j e^{ijf} \right|^2 \quad (1)$$

$I(f)$ behaves like $|f|^{-2d}$ for small f

d = 0.13 (true value = 0.10) - R2 = 0.04

Long-range dependence
Low-frequency earthquakes
Method
Application to earthquake catalogs
Perspectives

Graphical methods to estimate LRD
Application to synthetic times series

Synthetic times series I

1. Gaussian FARIMA (1, d, 0) with $\phi_1 = 0.5$ and the innovations follow a normal distribution $\mathcal{N}(0, 1)$.

2. Gaussian FARIMA (0, d, 1) with $\theta_1 = 0.5$ and the innovations follow a normal distribution $\mathcal{N}(0, 1)$.

3. Gaussian FARIMA (1, d, 1) with $\phi_1 = -0.3$, $\theta_1 = -0.7$ and the innovations follow a normal distribution $\mathcal{N}(0, 1)$.

4. Gaussian FARIMA (1, d, 1) with $\phi_1 = 0.3$, $\theta_1 = 0.7$ and the innovations follow a normal distribution $\mathcal{N}(0, 1)$.

5. FARIMA (0, d, 0) where the innovations follow an exponential distribution with rate $\lambda = 1$.

6. FARIMA (0, d, 0) where the innovations follow a lognormal distribution with parameters $\mu = 0$ and $\sigma = 1$.

Synthetic times series II

7. FARIMA(0, d, 0) where the innovations follow a symmetric stable distribution with scale equal to 1 and stability parameter $\lambda = 1.5, 1, 2$.

8. FARIMA(1, d, 1) with $\phi_1 = 0.3$, $\theta_1 = 0.7$ and the innovations follow a symmetric stable distribution with scale equal to 1 and stability parameter $\lambda = 1.5, 1, 2$.

9. FARIMA(0, d, 0) where the innovations follow a Pareto distribution with shape $\lambda = 1.5$.

10. FARIMA(0, d, 0) where the innovations follow a skewed stable distribution with scale equal to 1, skewness equal to 1 and stability parameter $\lambda = 1.5$.

Choice of the method

LFE time series look more similar to an ARFIMA process with Pareto innovations (synthetic time series 9).

For this synthetic time series, the variance of residuals method gives the best results.

Future work

- Modeling the sequence of LFE occurrence times.

- Epidemic Type Aftershock Sequence (ETAS) model unsuccessful:
  - Model does not fit well the time sequence.
  - Model cannot reproduce the long-range dependence.

- Future work: Use more complex models based on neural networks.
